# Recorded Future and Swimlane

Swimlane's SOAR platform helps organizations manage the growing volume of alerts more efficiently by automating time-consuming incident response processes. The solution collects security alert data from any connected security platform and then can automatically respond using automated workflows and Playbooks.

The Swimlane and Recorded Future integration enables the Swimlane SOAR platform to quickly reference valuable threat intelligence and use it to immediately enrich, remediate and respond to events and alerts. The integration also makes the Record Future data available in Swimlane case records saving valuable steps and time when analyst involvement is required.

AUTOMATED INTELLIGENCE GATHERING

With this integration between Swimlane and Recorded Future, workflows can be utilized to perform otherwise manual intelligence queries instantly or at the push of a button. This saves users time on every alert and allows them to respond to other alerts at a faster pace.

BENEFITS:

- Enables analysts to instantly reference and use the enrichment and research data in the case record

- Tasks to quickly reference the available data and support condition-based subsequent actions

- Provide one-off tasks within the case record to avoid the time lost working multiple windows, systems or site

RESULTS*

- Identify 22% more security threats before impact

- Improve response times by 63%.

DATA SHEET

FALSE POSITIVES

Many alerts coming from the SIEM ultimately are determined to be false positives once they are investigated in depth using Recorded Future. Analysts are still required to spend valuable time evaluating these alerts until they have enough supporting data to indicate it is benign. Many of these lower level and repetitive false positives can be automatically evaluated and handled using workflows that eliminate the need for analyst involvement.

CENTRALIZED DATA

In today's cyber security world, many businesses and SOC's are using more than one tool for intelligence and enrichment. With this integration, all of the data coming back from Recorded Future can be centralized along with data from your other connected tools. This allows users to see the bigger picture and saves time going back and forth between products.
